

Databases with Python

May 23rd, 2024 | 18h - 20h

About Pyladies Bratislava

1. Non-informal group
2. Respectful and non-judgemental
3. Learn and share Python stuff
4. Feel free to interrupt anytime with your questions, doubts, comments, whatever

Databases with Python

How to interact with a database

What is a database?

A database is a digital system for storing and managing organized data.

Types of databases

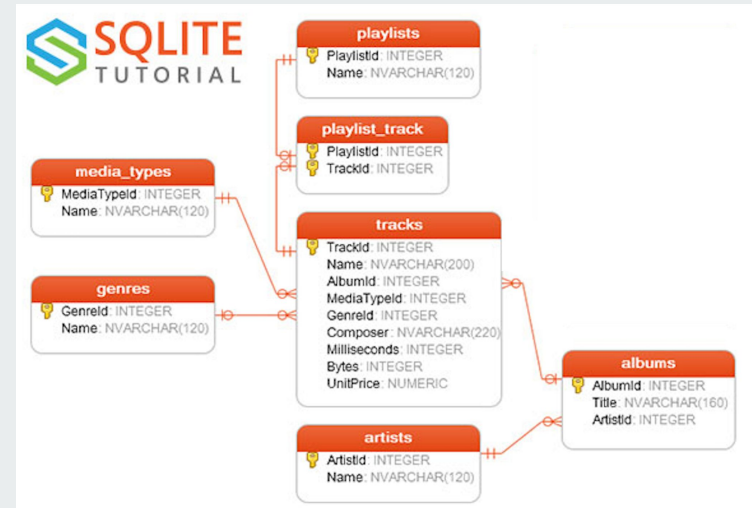

1. **Relational:** MySQL, PostgreSQL, Oracle, Microsoft SQL Server, SQLite
2. **Non-Relational (NoSQL):**
 - a. *Document:* MongoDB, CouchDB
 - b. *Key-Value:* Redis, DynamoDB
 - c. *Column-Family:* Apache Cassandra, HBase
 - d. *Graph:* Neo4j, Amazon Neptune
3. **Specialized:** Redis, Memcached, InfluxDB, TimescaleDB
4. **Other:** Google Spanner, CockroachDB, VoltDB, ObjectDB, db4o

Questions

1. Why do we need databases?
2. What are relational databases?
3. What are NoSQL databases?

Relational databases

- Store data in tables with rows and columns. Data is accessed using SQL
- Tables
 - Columns
 - Rows
 - Keys
 - Primary keys
 - Foreign keys

SQL - Talk to a relational DB

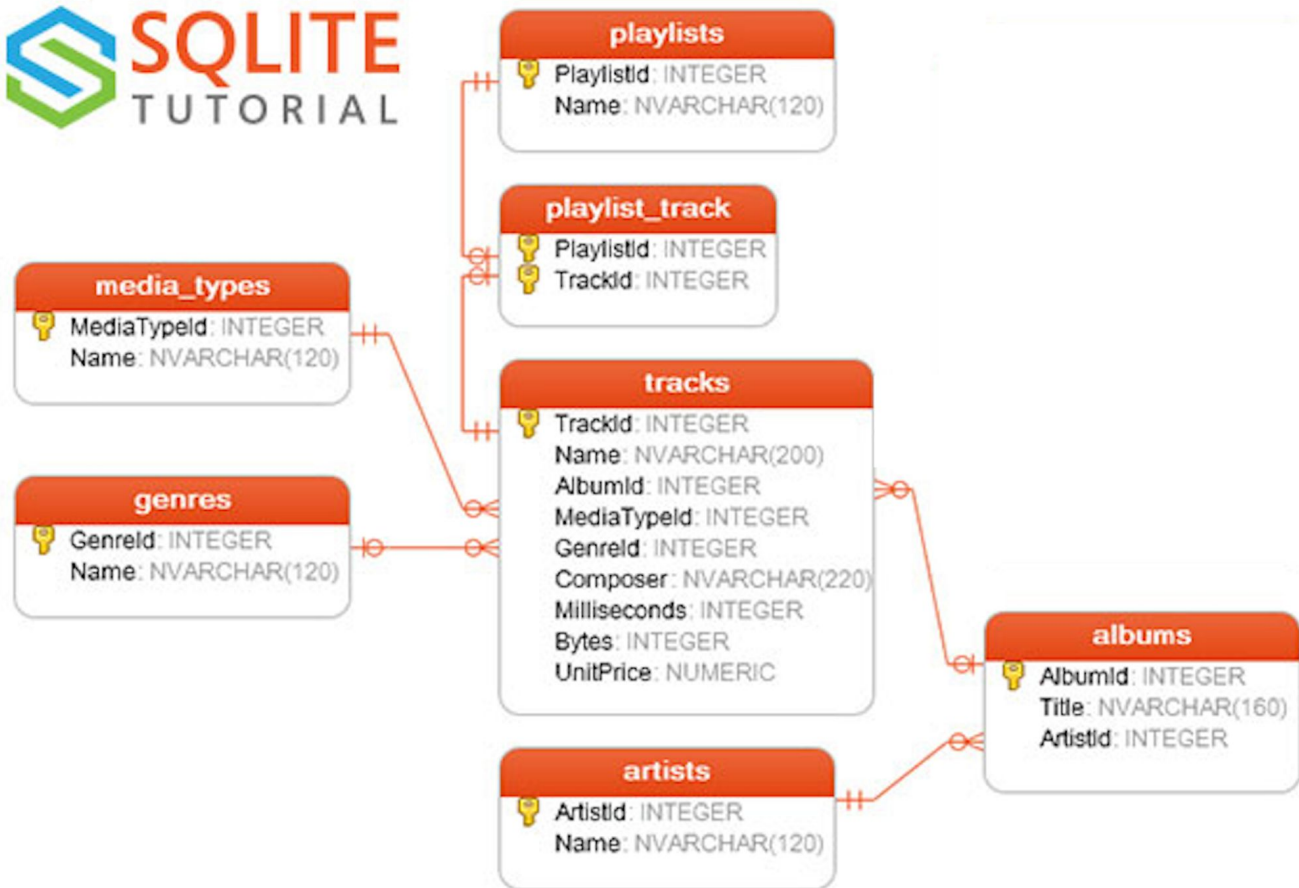

SQL Keywords:

- SELECT
- FROM
- WHERE
- AND
- OR
- ORDER BY
- COUNT

Sqlite3

- Python built-in:
 - `import sqlite3`
 - <https://docs.python.org/3/library/sqlite3.html>
- Download this sample DB:
 - <https://github.com/pyladies-bratislava/databases/blob/main/music.db>
- Connect to the DB and write some SQL queries

Sqlite

```
import sqlite3

sql = "SELECT COUNT(*) FROM artists;"

# Connect to the database
connection = sqlite3.connect("music.db")

cursor = connection.cursor()
cursor.execute(sql)
result = cursor.fetchone()
print(result)
cursor.close()

# Close the connection to the database
connection.close()
```

An sqlite database is a **file**.

A **connection** is a way to **interact** with that **file**.

A **cursor** allows us to retrieve and manipulate data **row by row**.

Exercises

1. Write a Python script that returns:
 - a. How many artists there are.
 - b. How many tracks there are.
 - c. The names of all media types.
 - d. The names of all genres.
 - e. All the albums from "U2"
 - f. All the tracks from the "Rattle and Hum" album from "U2"
 - g. All the artists alphabetically ordered

Questions

1. Why do I need SQL?
- 2.

Next steps

- sqlalchemy
- ORMs

Takeaways

What do you take with you?

What do you want start doing?
